

Dedication

*This thesis is dedicated to
MY GRANDMA,
LT. AMUDINI ROY CHOUDHURY,
the ocean of love & affection.*

Acknowledgements

I do hereby acknowledge receipt the help, cooperation and inspiration from Prof. Asoke Kumar Sen of Assam University who guided me in the right direction from the very inception of undertaking the voluminous task of the thesis titled, “The cometary activities as studied through imaging polarimetry” and convey my gratitude and thanks to him for his proper guidance and nourishment. As a research guide, to me, he is unique and unparallel having vast knowledge in the subject with strong personality. His association and guidance unfolded a new dimension before me.

In connection with the CEFIPRA (Indo French Center for the Promotion of Advanced Research) funded project, named “Cometary grains: observations and simulations” , I had the occasions to work with Dr. Edith Hadamcik, LATMOS and Prof. Robert Botet, University of Paris South; who helped me a lot in the long journey of research work and in fact my thesis would not be completed if I were deprived from their help. Their guidance was, indeed, a boon to me to accomplish my work.

I express my thanks and gratitude to Late Prof. Ramendu Bhattacharjee for his moral support and inspiration in the research work since the day of interview for Ph.D. He guided me a lot on gesture, posture and expressions that should be maintained before interview board.

I also express my sincere gratitude to Dr. Himadri Sekhar Das, Asst. Professor, Assam University who helped in many ways, especially by explaining various issues related to my research work. I had the occasion to accompany Dr. Das to Israel in December, 2015 in connection with a workshop and while in the trip

there, his tips helped me to accomplish the resource work to a great extent.

It would be an act of ungratefulness if I do not acknowledge Dr. Atri Deshmukhya, Associate Prof., Assam University who is the source of encouragement, mirth and merriment in various fields including cultural and social activities. Her every word seems to me as a source of delight and blissful.

I convey my thanks to all the faculty members, technical and non technical staffs of the Physics Department who extended cooperation in need.

I would like to acknowledge whole heartedly, the gracious financial help in the shape of scholarship accorded by CEFIPRA (Indo French Center for the Promotion of Advanced Research) funded project with grant no. 4507-1.

I am thankful to the authority and other members and associates of IUCCA of Pune, Maharastra for providing me the opportunities to take observation from IUCAA Girawali Observatory. Also, I thank authorities of Haute Province Observatory, who provided their data to me for analysis.

I am grateful to my uncle, Late Mrinal Kanti Roy Choudhury, Ex-Principal, Janaki Charan Higher Secondary School, Kalinagar, Katakhal a man of progressive views in social matters and ideal teacher. It was he who beautifully illustrated the root of Mathematics before me when I was in a dilemma to chose a stream for further studies. The fear psychosis that grew in my mind about Mathematics and Science was removed and I began to love Mathematics and Science and in course of time Science occupied a considerable space in my mind.

In fact, I would have gone astray and choose other profession for livelihood had I not come in close touch with the scholar couple, Dr. Sukhamoy Bhattacharya, Ex-Principal, Cachar College, Silchar and Prof. Swapna Devi, Dean of School of Languages, Assam University. They persistently insisted upon me to

go in for education line and moulded my life to choose the line of an academician. It is the tireless efforts of theirs from my very boyhood days that I am going to establish my aim in life. The Vivek Bahini, Silchar paved the way to be acquainted and associated with them. I am grateful to them and also to Vivek Bahini.

When I was a student of class IX, I had a golden opportunity to participate in the workshop named 'Roaming in the sky' organised by G.C.College, Silchar in 2001 in collaboration with 'Jagadish Bose National Science Talent Search'. During the workshop, I had the opportunity to see the planets and stars in the sky with telescope. The views of the Jupiter and the Saturn etc. were beautifully illustrated before us by the scientists and organisers and, in fact, I was tempted too much in the astronomical world and made up my mind to gather fair knowledge and get myself qualified in the said field. The choice of Astrophysics as special subject in the Masters Degree is one of the reasons. I convey thanks from the core of my heart to the organisers of the workshop.

I am also thankful to the members of our joint family comprising my parents, uncles, aunts and cousins for providing me a good academic atmosphere at home - a celestial abode. They encouraged me in every step and kept me aloof from family burden.

In fine, I shall be failing in my duty if I do not express my gratitude to my friends, who were associated with me during all the good and/or bad times and encouraged me to make my mission a success. I do express gratitude to the numerous others who helped me in very many ways to fulfil my dream.

I do believe that this thesis of mine will be beneficial to the students and researchers. I am optimist to receive appreciation for the research from all corners in the days to come.

Contents

Abstract	i
List of Tables	viii
List of Figures	x
1 Introduction	1
1.1 Introducing comets	1
1.2 Earliest records of comet apparitions	2
1.3 Discussion on nature of comets: heavenly bodies or atmospheric phenomena	3
1.4 Confirmation of comets' celestial nature	4
1.5 Trajectories of comets	5
1.6 Origin of comets: Interstellar visitors or members of the solar system	6
1.7 Cometary orbits	8
1.8 Structure of comet	9
1.9 Importance of studying comets	13
1.10 Motivation behind the present work	15
1.11 Objective and layout of present work	16
2 Light scattering theory: Polarization	17
2.1 Briefing polarization	17
2.2 Historical note	18
2.3 Physical basis of polarization by scattering	19
2.4 Wave equation	20

2.5	Optical polarization	22
2.6	Elliptical parameters of the polarization ellipse	24
2.7	Stokes polarization parameters	28
2.8	Derivation of Stokes parameters	29
2.9	Stokes parameters in complex form	32
2.10	The Stokes vectors	33
2.11	Polarization in terms of Stokes parameters	34
3	Observational technique: Polarimetric	35
3.1	Polarimetry	35
3.2	Early observations	36
3.3	Sources of astrophysical polarization	36
3.3.1	Light scattering:	36
3.3.2	Zeeman effect:	37
3.3.3	Synchrotron emission:	37
3.3.4	Dichroic absorption:	37
3.3.5	Birefringence:	38
3.4	Astronomical polarimetry (optical)	38
3.4.1	Single beam polarimetry:	39
3.4.2	Double beam polarimetry:	40
3.5	The Müller matrices for polarizing components	42
3.5.1	Müller matrix for polarizer:	44
3.5.2	Müller matrix for retarder:	46
3.5.3	Müller matrix for rotator:	48
3.5.4	Müller matrix for rotated polarizing components:	50
3.6	Calculating the polarization	52
3.7	Polarimetric calibration measurements	55
4	Literature survey: Polarimetric study of comets	57
4.1	Partial linear polarization of comets	57
4.2	Polarimetric observations of comets: beginning to modern era	58
4.3	Phase-angle dependence of linear polarization	59
4.3.1	Important features of polarization:	60

<i>CONTENTS</i>	vii
4.3.2 The two distinct branches:	60
4.3.3 Model for polarization phase curve:	62
4.4 Classification of comets based on polarization	64
4.5 Morphological features	67
4.6 Imaging polarimetry	70
4.7 Numerical simulation	74
4.8 Importance of polarimetric study	76
5 Polarimetric observations of some comets	78
5.1 The recently observed comets	78
5.2 Instrumental details	80
5.2.1 Telescopes:	80
5.2.2 Filters:	83
5.3 The observation of five comets	83
5.4 Basic reduction and calibration of imaging data	86
5.4.1 Software used:	86
5.4.2 Course of actions:	86
6 Results and interpretations	90
6.1 Background discussion of present work	90
6.2 The results obtained	91
6.2.1 Intensity images:	92
6.2.2 Linear polarization:	102
6.3 Discussions on present set of results	108
6.3.1 Intensity variations in the coma:	108
6.3.2 Polarization phase curve:	110
6.3.3 Polarization maps:	115
6.4 Comparative study with other results	117
6.5 Conclusion	120
Bibliography	141
List of Publications and Presentations	xi

List of Tables

5.1	Central wavelength and band passes of the filters.	83
5.2	Log of observations of comets under study.	85
5.3	Polarized and unpolarized standard stars.	89
6.1	Polarization values P_r (in %) of Garradd for different apertures and wavelengths.	103
6.2	Polarization values P_r (in %) of Gehrels for different apertures and wavelengths.	104
6.3	Polarization values P_r (in %) of Lulin, C/2011 L4 and Jager for different apertures and wavelengths.	105

List of Figures

2.1	Elliptically polarized wave and the polarization ellipse.	23
2.2	The rotated polarization ellipse.	24
3.1	The main optical components in a typical dual-beam imaging polarimeter.	41
3.2	Interaction of a polarized beam with a polarizing element.	43
3.3	The Müller matrix of a polarizer with attenuation coefficients p_x and p_y	44
3.4	Propagation of a polarized beam through a retarder.	47
3.5	Rotation of the optical field components by a rotator.	49
3.6	Derivation of the Müller matrix for rotated polarizing components.	51
4.1	Positive polarization branch for several comets.	61
4.2	Negative polarization branch for several comets.	62
4.3	Evidence for two classes of comets from their polarimetric properties.	65
4.4	Showing third class of comets along with other two classes.	65
4.5	Different radial and azimuthal structures showing coma morphology.	68
4.6	Polarization maps and emphasized intensity images by a rotational gradient method emphasizing the jets and fans regions.	71
6.1	Radial, solar, anti-solar profiles of intensity for Gehrels.	93
6.2	Radial, solar, anti-solar profiles of intensity for Lulin, C/2011 L4, Jager.	95
6.3	Morphologies in intensity for Garradd.	97

LIST OF FIGURES

x

6.4	Morphologies in intensity for Gehrels.	98
6.5	Morphologies in intensity for Lulin,C/2011 L4,Jager.	99
6.6	Polarization map of Garradd.	106
6.7	Polarization map of Gehrels.	107
6.8	Polarization map of Lulin, C/2011 L4, Jager.	108
6.9	Fitting whole coma polarization values of comet Garradd with the synthetic phase curves.	111
6.10	Fitting whole coma polarization values of comet Gehrels with the synthetic phase curves.	112
6.11	Fitting whole coma polarization values of comets Lulin, C/2011 L4, Jager with the synthetic phase curves.	113
